

APOLLO

APOLLO – FASTER PERSONALIZED DIAGNOSTIC IMAGING

Cerebriu improves workflow efficiency, quality and patient outcomes in diagnostic imaging. Our software solution Cerebriu Apollo achieves this by automating image acquisition protocols and triage during MRI brain acquisition providing decision support at key stages of the diagnostic process. Ultimately this results in improved productivity, prioritizing the right patients at the right time and less stress for clinicians.

SMART PROTOCOL

Significantly reduces MRI scan time and data providing protocol decision support during image acquisition based on clinical findings.

TRiage ADVISORY

Improves logistics and reduces unnecessary admissions providing triage decision support during image acquisition based on clinical findings.

IMAGE REPORTER

Verifies and accelerates reporting, providing visualized mark-up of regions of interest during scan and later in PACS.

version 1.0-b12daf3 Apollo is regulated as a medical product. This product conforms to Medical Device Directive 93/42/EEC

Cerebriu A/S Dampfærgevej 28 DK-2100 København Ø 2020 Cerebriu A/S

Cerebriu Apollo saves time, improves patient safety, and personalizes the diagnostic imaging process.

Apollo Smart Protocol analyzes images in real-time during acquisition and recommends which sequences should be acquired based on the patient's unique findings, saving time and ensuring the correct sequences are captured the first time the patient is in the scanner.

Apollo Triage Advisor performs triage immediately after acquisition to ensure the most clinically important scans are reviewed by the radiologist first.

Apollo Image Reporter guides users to abnormalities, enabling faster reporting and attention to clinically important findings for all clinicians involved in the patient's care.
